SOFTWARE

Information technology: its new meaning for art

Gerbils match wits with computer-built environment
SOFTWARE, an exhibition sponsored by American Motors Corporation

The Jewish Museum
September 16 through November 8, 1970

The Smithsonian Institution
December 16 through February 14, 1971
Software is an exhibition which utilizes sophisticated communications technology, but concentrates on the interaction between people and their electronic and electromechanical surroundings. This is the same exploration, in human factors, which we use in the engineering design of our automobiles as a human environment.

This exhibition encourages artists to use the medium of electronic technology in challenging and unconventional ways. The link between art and science, which the artists in Software are examining, is the same link we must explore and strengthen in our automotive styling and engineering.

Because of our continuing interest in people, in technological achievement, and in the advancement of modern art forms, our involvement in Software has been both rewarding and stimulating.

Notes on art and information processing

Jack Burnham

Software is not specifically a demonstration of engineering know-how, nor for that matter an art exhibition. Rather in a limited sense it demonstrates the effects of contemporary control and communication techniques in the hands of artists. Most importantly it provides the means by which the public can personally respond to programmatic situations structured by artists. Software makes no distinctions between art and non-art; the need to make such decisions is left to each visitor. Hence the goal of Software is to focus sensibilities on the fastest growing area in this culture: information processing systems and their devices.

In just the past few years, the movement away from art objects has been precipitated by concerns with natural and man-made systems, processes, ecological relationships, and the philosophical-linguistic involvement of Conceptual Art. All of these interests deal with art which is transactional;
they deal with underlying structures of communication or energy exchange instead of abstract appearances. For this reason most of Software is aniconic; its images are usually secondary or instructional while its information often takes the form of printed materials. In such forms information processing technology influences our notions about creativity, perception, and the limits of art. Thus it may not be, and probably is not, the province of computers and other telecommunication devices to produce art as we know it; but they will, in fact, be instrumental in redefining the entire area of esthetic awareness.

"The concept of cybernetics now represents a kind of historical snapshot, the germ of an insight expanded and modified far beyond its origins."

Planning for the Software exhibition began early in 1969 when Karl Katz assembled representatives from the art and the computer fields to review the feasibility of such an undertaking. The theme at that time was vaguely "cybernetic" or a sequel to the Museum of Modern Art's "The Machine as Seen at the End of the Mechanical Age" (1968). More than anything, those early discussions were memorable for communication obstacles between laymen and experts in their respective fields. Somehow the term cybernetic meant little or nothing to the art representatives present—except that it epitomized a very complicated and important field—while it stood for an idea already a little too general and passé to computer specialists.

A touchstone which we all shared in those first months was Cybernetic Serendipity: The Computer and the Arts, a book-catalogue compiled and edited by Jasja Reichardt for her exhibition at the London Institute of Contemporary Art in 1968. In a most complete way, her exhibition attempted to document how computer and various cybernetic devices have been used creatively, both within and beyond the arts. Cybernetic Serendipity contained much basic information on the historical development of digital computers. It included scientific experiments and works by artists which utilized the principle of feedback in machines designed to respond to external and/or internal stimuli. Other exhibits featured printouts (visual diagrams) from computers as used in music analysis and music synthesis, computer graphics and movies, computer-designed choreography, and computer poems and text analysis. Since Cybernetic Serendipity was in many ways a very comprehensive exhibition in the form of an historical résumé, we felt that Software should not cover the same ground. Moreover, we wanted to use computers in a museum environment, a sizable technical feat which the earlier exhibition did not attempt.

In the spring of last year we set about redefining the scope of the present exhibition as "The Second Age of Machines". In regard to this, one of the landmarks in the history of science occurred in 1947 when the M.I.T. mathematician Norbert Wiener along with his colleague Arturo Rosenblueth of Harvard, coined the word Cybernetics. At a basic level, Cybernetics refers to "the set of problems centered about communication, control, and statistical mechanics, whether in the machine or in living tissue." Wiener's subsequent research, along with that of many other scientists, led to a working concept that the behavior of all organisms, machines, and other physical systems is controlled by their communication structures both within themselves and with their environments. Research and development in the last twenty years has led to so many new ideas that the concept of cybernetics now represents a kind of historical snapshot, the germ of an insight expanded and modified far beyond its origins. In a sense, the original purpose of Cybernetics was to produce a unified theory of the control levels and types of messages used by men and machines and processes in normal operation. Thus the history of computer technology may be interpreted as progress in making communication between men and machines more natural and complete. This remains an ideal definition however, because quite often in industry human beings have been adapted to inhuman machine schedules, rather than the other way around. What is less realized is that most businesses of any size have had to adapt themselves, more or less traumatically, to radically different patterns of administration and organization as the result of information structures made possible by computer systems. So in part Software addresses itself to the personal and social sensibilities altered by this revolution. By and large these alterations have been internal, in the form of new procedures and ways of dealing with physical reality, rather than purely visual responses. With this in mind, Les Levine suggested the name for the present exhibition.

Throughout the history of computer technology 'software' has always meant changeable programs and procedures. Its genesis could be related to an idea held by the mathematician and computer scientist Marvin Minsky. He compares our intellectual conception of machines to the duality of the mind-body question which philosophers have pondered and debated for hundreds of years. All solutions to the problem, either idealistic or materialistic, contradict evidence which the body presents of its own functioning. But for practical purposes we have contented ourselves with the dualism that the body functions as one form of activity and the mind as another. Minsky states that "One area concerns mechanical, geometrical, and physical matters; the other deals with things like goals, meanings, and social interactions. When we see an object we account for its mechanical support in the first domain—we ask who put it there and why in the second."

"Our bodies are hardware, our behavior software"

Minsky concludes that we build machines in our own self-image—although such a separation between body and mind may be no more than an illusion fostered by our lack of scientific knowledge about human biology and communication systems in general. While the integrationist tendencies of systems design tend to play down such differences, in a very real way the division between software and hardware is one that tangibly relates to our own anthropomorphism. So in a sense this exhibition represents 'the state of art' as it is presently conceived. Yet it must be remembered that software originally referred to those aspects of a computer system most easily changed. This is no longer true since hardware sometimes can be replaced more quickly and cheaply than software. Here again distinctions begin to blur.

For computers, hardware components include processors, memories, display devices, communication equipment and other tangible computer subsystems. Software, or stored programs, has equal value, and perhaps with future refinement of computer systems it will be considered more important than hardware. The concept of
software includes general and special purpose computer languages, programs such as instructional procedures, dictionaries, and so forth. In addition to stored information, software has come to mean for some engineers the process of systems-design itself; thus systems procedures, from flow diagramming to putting computer systems in working order, all fall under the heading of software. Thinking in systems terms, hardware and software interact, determining each other's structure for a given problem. Consequently the tendency is to think of both in unified terms.

Supplementing the above description, Theodor H. Nelson, technical adviser for Software, provides these examples of software:

"Plans and procedures for action," as distinct from the equipment that carries the action out. Thus in a transportation system the hardware consists of cars, highways, traffic lights and policemen, while the software consists of rules, such as drive on the right, stop on a red light, etc. Another example: subway cars and tracks are hardware, routes A, E, and BB are software. Finally: our bodies are hardware, our behavior software.

Software is the part of a system which is more easily changeable. In computer design we recognize no absolute distinction between machines and programs; often we have a choice of wiring a certain mode of behavior into equipment, which is faster but more expensive, or leaving the behavior to be done by a program, which is more flexible and cheaper. This choice, a matter of economics and engineering preference, is called the "hardware-software tradeoff", a renowned problem. The situation is now made more complicated by introduction of the term firmware, additional changeable programs which effectively rewire the hardware.

Software has a third meaning of sorts. In publishing, the terms "hardware" and "software" have for some reason been adopted as meaning objects (such as physical books) and content (what's printed in them). This is unfortunate, since in computer-based text systems we must distinguish between the hardware (computer and reading screen), software (computer and display program) and content (what is read)."

"Machines carry on brilliant dialogues with articulate human beings and very uninspired conversations with dull people"

The term software has also been adopted by the commercial and advertising world to mean any kind of stimulus or environmental conditioning, possibly including the shaping of public opinion. This could also be construed as information taken from the environment by a system, living or inorganic. We might even expand the notion of software to include any kind of data, but already this annihilates the traditional distinction between software (procedures) and data (information operated upon). Nevertheless, the exhibition contains all of these overtones and probably a few not mentioned.

Used in the art format, any notion of software leads one to reconsider our historical notions of art. Normally the context of art is a painting, sculpture, or perhaps a gallery environment. Contexts lend meaning to art works or art ideas: they "frame" the work, so to speak. All works of art function as signs; that is they signify in some form or other how they are operative within the art context. Moreover, it is becoming evident that the material presences of frames or even gallery spaces are no longer necessary for placing signs in the art context. For sophisticated viewers, contexts are implicitly carried over from previous art experiences. Thus many of the exhibits in Software deal with conceptual and process relationships which on the surface seem to be totally devoid of the usual art trappings.

One of the purposes of Software is to undermine normal perceptual expectations and habits which viewers bring to an art exhibition. In some cases this is done by deliberately separating or isolating communication structures from their usual surroundings. In daily life we receive thousands of "messages", most of them unconscious, upon which we act. The same is true of behavior in an art gallery. Artists' messages are frequently ignored by a non-participant or someone without the needed training to respond to certain cues. In this sense the idea of Software detracts from the notion of art as a system of tangible expectations and predigested signs. Rather Software is about experiencing without the mental cues of art history. Instead it is saying: "sense your responses when you perceive in a new way or interact with something or someone in an unusual situation".

For this reason Software regards the perceived appearance of the art object as a fraction of the entire communication structure surrounding any art. Inspection rather than introspection is the point of the show.

The machines in Software should not be regarded as art objects; instead they are merely transducers, that is, means of relaying information which may or may not have relevance to art. Visitors to Software should have the opportunity to interact in varying degrees with the systems at hand. In all cases such "interaction" falls short of the level of richness found in ordinary human conversation. Yet another goal of Software is to make it clear that art itself is a form of intermittent dialogue. We are trying to make that sense of dialogue a conscious event.

A few years ago one of the inventors of the first conversational computer programs, Joseph Weizenbaum of M.I.T., observed that machines carry on brilliant dialogues with articulate human beings and very uninspired conversations, using the same program, with dull people. Any "art" that transpires—if such a term is needed—is the direct result of interaction between the computer's software and the "program" (behavioral idiosyncrasies) of a human being. In a similar sense, the printed materials which convey many of the conceptual works in the exhibition are not art in themselves; rather their concepts and processes, as perceived, recapitulate art experiences. Such a view of reality insists that nothing has art as an innate quality, but that the art context of an object or environment is always provisional and always open to challenge.

Such philosophy of insubstantiality appears to be a form of scientific Neo-Platonism—that is, knowledge free of the effects of direct sensory affirmation. The objective of Software, however, is to stress the fact that information is simply a measure of response between sender and receiver; the ability to change someone's mind about something is the measure of data's worth as information. (Note: In the computer field information is a commodity, something which has monetary value for a client. In the usual mathematical context of information theory, information is seen as a process between entities, one with no objective value for anyone.) All information becomes obsolete unless it remains in a meaningful context to us. The objective of art history and most retrospective disciplines is to counteract the natural effects of time on information by turning the past into a form of information.
which remains relevant in the future. If this seems exaggerated, consider the fate of many objects once removed from their elevated contexts in tourist guides and art histories. History is a conservative but necessary force which preserves by providing a mythical ambiance for objects and buildings that formerly would have been discarded.

In a very real sense the structure of a computerized society comes into direct conflict with the Art Ideal. As Warren Brody and Nilo Lindgren have written, using computers in a society dominated by traditional knowledge structures is an invitation to chaos. The writers observe that information is always defined by a point of view, whether a favored theory, an available technology, or a social condition. But in a world rapidly being forced to separate information from habitual procedures, "It is not even possible to gauge how deeply our classical concepts are rooted, until after we have adopted the evolutionary viewpoint that regards information as continuously being evolved from the unknown, metabolized into meaning, and finally reconstructed into noise... Man survives as a creature who continually changes and evolves, a creature who feeds on novelty, who reorganizes himself as he reorganizes his physical world and maintains stability by this process of change." It might be observed that presently in the United States a group of museums are creating the most elaborate index of known art works ever assembled—all to be filed in computer programs for the future use of all museums and scholars. It almost seems as though we are exchanging myths while retaining the original mythic structure, i.e., art history transformed into a kind of comprehensive electronic memory, one given to the same modes of mythic organization that pervaded tribal life in the past.

"No group of artists involved with computers and electronics is going to win compliments for their humanistic endeavors"

As a popular interpreter of technology Marshall McLuhan has commented on the same evolutionary values. In The Gutenberg Galaxy McLuhan defines machines of the nineteenth century, the effects of mass production, and the technology of the printed book as "homogeneous segmentation", or the proliferation of experience through duplication. This, according to McLuhan, is "the method of the fixed or specialist point of view that insists on repetition as the criterion of truth and practicality." For example, it is safe to say that the popularity and efficacy of modern art is to a large degree the result of good, cheap color reproductions produced by the millions. The magic of personal creativity in the Machine Age was, and to some degree still is, the recreation of the individual's gesture through the anonymous, all-pervasive means of the mass media. So, increasingly the importance of the work of art is seemingly in direct proportion to the number of times it is reproduced for popular consumption. Literacy, in McLuhan's judgment, produces a closed circuit of values, one that makes the distinction between art and non-art not only possible but necessary. In mythic terms, works of art are singular or unique; but paradoxically we reinforce this uniqueness through mass production of the art object's image. The non-literate tradition produced myths and tales which could be told over and over again in an infinite number of ways; with the coming of the book, their counterpart was the idea of the masterpiece. But again our concept of perpetuating important information may be changing; in McLuhan's words: "Today our science and method strive not towards a point of view but to discover how not to have a point of view, the method not of closure and perspective but of an open 'field' and the suspended judgment. Such is now the only viable method under electric conditions of simultaneous information movement and total human interdependence."

Software is McLuhan's idea of the present environment which cannot be art because it is not yet behind us and conceptually codified. For many visitors there will be no "art" in the motion pictures, conceptual displays, television monitors, computer-based readers, and time-sharing terminals of the exhibition—mainly because few art authorities have ever been convinced that these could contain an art experience. These activities, however, possess the sensory consistency of the oral tradition in pre-literate society. Where modifications and differences lie is still uncertain, but McLuhan has this to say about their effect upon experienced reality: "Thus the technique of suspended judgment, the great discovery of the twentieth century in art and physics alike, is a recoil and transformation of the impersonal assembly-line of nineteenth century art and science. And to speak of the stream of consciousness as unlike the rational world is merely to insist upon visual sequence as the rational norm, handing art over to the unconscious quite gratuitously. For what is meant by the irrational and the nonlogical in much modern discussion is merely the rediscovery of the ordinary transactions between self and the world, or between subject and object. Such transactions had seemed to end with the effects of phonetic literacy in the Greek world."

Yet the ultimate achievement of McLuhan's visions is still very distant. In many instances so far the information processing technologies have only aggravated the suppressed anxieties of Machine Age politics and economics. As demonstrated in Nelson's essay on "cybercrud", we seem to be the victims of a perpetual consumer's fraud, no matter how promising the hardware and software. In terms of the art world, no group of artists involved with computers and electronics is going to win compliments for their humanistic endeavors. Yet at some point an attempt has to be made to put the issues of all contemporary communication, not just esthetic communication into a questioning frame of reference. Already we have witnessed a revolution in usage. Twenty years ago computers belonged to a tiny, highly skilled, mathematical elite—a priesthood; ten years later laymen who bothered to master cumbersome computer languages could use them; and today, as evidenced by this exhibition, people with no special training have access to computers. Thus in practice there has been a steady trend towards democratization.

"It appears we cannot survive without technologies just as dangerous as the dilemmas they are designed to solve"

Yet this is a different age in which we are beginning to read aesthetics into budgets, planning procedures, and priorities—and not so much into finished products. When means become ends we ask such questions as how do electronic information processing systems affect the psychological outlook of the average human being? Furthermore, the possible goals and uses of super-human intelligent computer programs—if and when they become a
reality—are still very unclear even at the highest levels. Automation or semi-automation of work tasks does not insure that they are any less boring than before since much depends upon the job and planning that goes into them. Computer programming can be the most varied and creative activity that one can do on salary, allowing the most initiative and variety of personal means of expression. However, in some business situations a certain kind of low-level programming (also called “coding”) is employed; much worse, keypunching is certainly intolerable. Thus personal contact with such machines ranges from the most rewarding to the most boring and regimented experiences possible. On another level, computerized data files on individuals continue to be an extremely serious threat to human rights, and one against which there are few real protections. In a survey on the effects of computer data banks, Jerry Rosenberg finds it significant that the most negative attitudes are shared by people whose work exposes them to computerized data-gathering.

As our information storage problems expand in magnitude (along with our statistics needs and resource management problems in ecology) we are forced to confront the computer as one of the few practical solutions. This produces a very real paradox: it appears that we cannot survive without technologies potentially just as dangerous as the dilemmas they are designed to solve. We might ask ourselves if future generations of information systems will be used with any more sensitivity than radio and television have been up to now. Apparently once esthetics is removed from the tidy confines of the Art World, it becomes infused with ethical, political, and biological implications that are overwhelming but nevertheless critical.

Many of the finest works in the Software exhibition are in no way connected with machines. In a sense they represent the “programs” of artists who have chosen not to make paintings or sculptures, but to express ideas or art propositions. After experiencing examples of Conceptual Art, it becomes apparent that machines can only handle the ideas given to them by human beings. What machines do is to telescope and edit experiences in a way that printed materials cannot.

Again Software is not technological art; rather it points to the information technologies as a pervasive environment badly in need of the sensitivity traditionally associated with art. Since people will continue to make poems and paintings without computers, Software focuses on modes of creativity and creative assistance which are more or less unique to the electronic age. Remembering the Latin derivation of art, the term ars in the Middle Ages was less theoretical than scientia: it dealt with the manual skills related to a craft or technique. But present distinctions between the fine, applied, and scientific arts have grown out of all proportion to the original schism precipitated by the Industrial Revolution. Thus Software makes none of the usual qualitative distinctions between the artistic and technical subcultures. At a time when esthetic insight must become a part of technological decision-making, does such a division still make sense?

Curator Jack Burnham consults with Exhibition Coordinator Joanne Lupton
An installation design that minimizes ‘museum atmosphere’

I did not anticipate the difficulty of the installation when a group of us attended a meeting at which the concept for the exhibit was established. The first realization of a unique exhibition design and installation problems came months later with the realization that the work of many artists produces no objects. Equipment there is—but no “objects of art”.

Inside the museum, the visitor will find lightness and darkness, two constant elements of day-to-day existence. This is both a lighting and color consideration. Light and dark shades of gray (for concrete or metal) were discarded. Software is not restricted to the city, nor to machines. Noise levels from machinery, it was decided, would be dealt with at installation—we live with noise and we have learned that we tolerate it within certain bounds. Visitors to the exhibition will have to concentrate because we are not isolating individual works of art to be appreciated. Hopefully nothing is hidden and nothing is obvious.

James A. Mahoney, Exhibition Designer
The crafting of media
Theodor H. Nelson

The strange revolution of our information environment has only begun; yet it has begun in such an obscured and clouded form that the public sees only various meaningless disguises.

The all-purpose machine, as von Neumann called it, has been falsely promulgated to the public as the so-called computer, numerical, uncompromising, demanding and intractable. It has profited certain computer companies to make "computers" and their associated techniques incomprehensible and awesome; these same companies now seem unprepared for the widespread public revulsion to this image of the computer. It has profited some computer companies to build ungainly and obscure systems for business purposes, badly related to what their business customers do; and to con the customer and his poor employees into believing it has to be that way; this keeps the hapless customer on the hook indefinitely. These same companies now seem unprepared to have their all-wisdom questioned.

I would like to employ the word cybercrud to mean, in general, putting things over on people using computers. Cybercrud is one of the most important specialties, if not the economic backbone, of the computer field. The promotion of false or clumsy approaches to a problem as "scientific," the frequent claim that "the computer has to have it that way"—when a certain thing could be programmed very differently—are cybercrud.

But the computer is an all-purpose machine, and the computer display—a screen programmed to present text and pictures somehow stored in the computer—is a universal miraculous communication tool, as Ivan Sutherland showed in the early sixties with his Sketchpad system. And computer prices, unlike other prices, go down relentlessly. Expensive as these devices may be today, within the decade small good ones will cost a few hundred, at most a few thousand dollars. As we learn to free ourselves from cybercrud, the question becomes not, "how do I relate to this sinister, demanding artifact?" but "what is the grooviest way to use this thing?"
The human environment can now be wholly, wonderfully redesigned. What do we want? What do we want??

What do we want??

Until now, our media—letters, books, television—have been based on specific inventions and technical connections. But no longer are specific inventions of special importance: information may be commuted to any form, functioning networks may be built connecting any device to any other device; total trans-pluggability has come. (Imagine if you will a device with a red oval 2-inch TV screen, a set of chimes in the natural key of C, a smell generator capable of giving off most smells, and a foghorn. Should the F.C.C. authorize this combination as a broadcast medium?)

The design of media is thus in a sense a new art; before, we could tinker little with the package. I suggest the term "fantics" for the art and technology (in that order) of showing things; the crafting of media for human communication purposes is therefore its most important franchise, something like "city planning" in generality. Making things look good, feel right, and come across clearly should be a general objective.

We should distinguish between media and facilities. A facility is an available activity, or function, like a movie splicer or desk calculator. A medium is a set of presentation elements, and relations among them, that may be used by a person to create an object, environment or experience for someone else.

Creating media that are organized, then, clear and easily related to the human mind, is our task. Creating media that are focussed, or gently converging, is the delicate part. Rather than present a user with ideas and activities stretching limitless in all directions, a presentational system should help organize his work and attention.

This is the age of option. For instance, we may have anything we want on display screens—text or diagrams or both, moving or flickering or interacting or whatever. What do we want?

This is also the age of crunch. Ecstatic possibilities must survive various forbidding or shaping factors that might cut them down. In the design of media these include not merely economics and technicalities (such as transmission rates on phone lines), but social structure and motivation (what will the teacher put up with in the classroom? Why don’t students use the language laboratory?).

Hypertexts and hypergrams, then, are two new species of media for the computer age: personal, dynamic, and contradictory of the heavy-handed and stupid "computer" in the general stereotype. Hypertext, or writing that can branch or perform, is seen in the Software show’s "Labyrinth" piece, wherein the visitor may browse through a maze of writings on the screen. "Hypergrams," branching or performing pictures, will be the pictorial equivalent. Designing the detailed activities of the presenting systems is an important task, demanding technical knowledge, love and appreciation for words and pictures, and a sense of alternatives and inspiration.

The new age will not be "scientific." The word "scientific" is obsolete (except where specifying the activities and problems of scientists), like the adjectives "modern" and "streamlined." The technological imperative is a fake, computerization can take whatever form we wish it to; therefore we must learn about computers in order to wish better. As Burnham says at the end: "...Software makes none of the usual qualitative distinctions between the artistic and technical subcultures. At a time when esthetic insight must become a part of technological decision-making, would such divisions make sense?"

Labyrinth: An Interactive Catalogue 1970
with assistance from Scott Bradner (Art & Technology, Inc., Boston)
Digital Equipment Corporation (time share PDP-8 computer)

Labyrinth is a hypertext, or interactive text retrieval system.
To read in this interactive catalogue, the user sits down at one of many Labyrinth keystope terminals and begins to read. To read more of any section which is larger than the screen, the user types F (forward). To go back to the beginning of the catalogue, the user types R (return). To obtain a related section as indicated by an asterisk appearing in the text, the user types the code appearing with the asterisk.

Before leaving the show, the museum goer may obtain a printout of what he himself has selected to read in the interactive catalogue by giving his name to an attendant at the line printer by the main exit.

This catalogue system was programmed for the PDP-8 by Ned Woodman of Art & Technology, Inc. Interesting features of the program include the ability to output to any display scope, a temporary terminal history to allow the forward and return commands, a permanent user history permitting a final printout. The interactive catalogue for software consisting of information from the printed catalogue and additional materials has been edited by Theodor H. Nelson, who has been advocating hypertexts as a form of writing for some ten years. This is the first public demonstration of a hypertext system.
LIFE IN A COMPUTERIZED ENVIRONMENT
The gerbils live in a glass-walled house with a roaming electromagnet overhead, picking up and depositing two-inch cubes.
Seek is a sensing/effecting device controlled by a small general purpose computer. In contrast to an input/output peripheral, Seek is a mechanism that senses the physical environment, affects that environment, and in turn attempts to handle local unexpected events within the environment. Seek deals with toy blocks which it can stack, align and sort. At the same time, these blocks form the built environment for a small colony of gerbils which live within Seek's three-dimensional world.

Unbeknownst to Seek, the little animals are bumping into blocks, disrupting constructions, and toppling towers. The result is a substantial mismatch between the three-dimensional reality and the computed remembrances which reside in the memory of Seek's computer. Seek's role is to deal with these inconsistencies. In the process, Seek exhibits inklings of a responsive behavior inasmuch as the actions of the gerbils are not predictable and the reactions of Seek purposefully correct or amplify gerbil-provoked dislocations.

Seek consists of a 5x8 foot superstructure supporting a carriage which has three dimensions of freedom. Its extremity is composed of an electromagnet, several micro-switches, and pressure-sensing devices. This elementary prosthesis is guided by the blind and handless computer to pick up or deposit its payload of a single two-inch cube. The nucleus of the system is an Interdata Model 3 Computer with 65536 single (yes/no) bits of memory which are shared by instructions and data.

Even in its triviality and simplicity, Seek metaphorically goes beyond the real-world situation, where machines cannot respond to the unpredictable nature of people (gerbils). Today machines are poor at handling sudden changes in context in environment. This lack of adaptability is the problem Seek confronts in diminutive.

If computers are to be our friends they must understand our metaphors. If they are to be responsive to changing, unpredictable, context-dependent human needs, they will need an artificial intelligence that can cope with complex contingencies in a sophisticated manner (drawing upon these metaphors) much as Seek deals with elementary uncertainties in a simple-minded fashion.

Seek has been developed and constructed by M.I.T. students who form part of the Architecture Machine Group, a Ford Foundation sponsored research effort within the M.I.T. Urban Systems Laboratory. The participants have ranged from freshmen working in an Undergraduate Research Opportunities Program, to post-graduates designing elements as part of their research assistantships.

The co-directors of the group are Professors Nicholas Negroponte and Leon B. Groisser, of the faculty of Architecture and Planning. Randy Rettberg and Mike Titelbaum, students in Electrical Engineering, have been in charge of the electronics—in particular, the interface and controller. Steven Gregory, a graduate student in the School of Architecture and Planning, has been in charge of the programming. Steven Peters and Ernest Vincent have been responsible for the actual construction of the device.

Following the Software exhibition, Seek will return to M.I.T. to be used with many different detachable heads as a general purpose sensor/effect. Seek will become a frame for experiments conducted by students in computer-aided design and in artificial intelligence.

Sonia Sheridan
Interactive Paper Systems 1969-70

Part of the basic equipment for Interactive Paper Systems, a 3M Thermofax machine is simply a revolving belt which permits a treated paper to react to carbon as it passes in seconds through the heated machine. Demanding no special training, it can be used to produce a variety of color transparencies, spirit masters, stencils and opaque copy. Through experimentation we have discovered that some of its artistic uses lie in making large projection transparencies, copy for film making, transparencies for photo screening, freak color separations, instant textile design, image distortion and transparency collages.

The Color-in-Color machine, available for a portion of the exhibition time, is a recent 3M invention which translates into full color any two or three dimensional object which can fit in its 8'x10' format. This instrument is a major breakthrough in the graphics field, for it can produce an endless variation of images within a span of minutes. In the hands of a creative person neither the size nor the quality of the image is limited. It can be adapted to produce images on either paper or onto a matrix, which is then transferable to any heat resistant material by means of an ordinary iron or a companion Color Processor. We have considered using this instrument for rapid film animation, instant 2-3D books, rapid textile design, light printing with stencils, colorful and dynamic correspondence and a variety of other possibilities. Michael Schumacher has done some fine photomontage work with this machine. Keith Smith exploded the size limitation by cutting up Kodak positives and ironing them onto a huge quilt combined with silkscreen and photographs. Cosmo, a team of Robert Frontier and William McCabe, rephotographed the Adlai Stevenson family album on the machine, took slides and projected them so that black and white photos were completely altered. We have been able to increase the variety and volume of correspondence and to carry on interactive graphics with artists, inventors and businessmen.

The capacity of the new graphic machines for instant production has the most profound implications for the visual world. The artist, who once spent hours rendering an orange can photograph the orange whole, cut up into any variety of forms, or squeezed into juice, and can rephotograph it within minutes. In an hour's time he can produce 120 variations; in eight hours he can have almost 1000 different versions of the orange. It is obvious that this work process becomes another kind of time for the artist as the distance from conception to conception is reduced to minutes and objects change as rapidly as thinking allows.

Equipment on loan from the 3M Corporation
1. Thermal Experience Zones identified by tape present the heat capacity of a variety of surfaces to the viewer's touch. Sources of heat of these surfaces include the sun, the Museum heating system (if operating) heat from the interior of the earth, heat of lighting and other electrical equipment, heat of pollutants, heat of friction, heat of the bodies of spectators.

2. Museum as Thermal Experience Zone. A test points to the entire space of the Museum as a Thermal Experience Zone, and to the body of the viewer as the sensing agent. The test will measure the perspiration of randomly chosen subjects for the duration of their visit to this exhibition. Factors involved may be the heat of the spaces, the heat of the subjects' bodies, their clothing, their physical and mental and nervous activity. Persons taking the test will be identified with a badge stating: "I am taking a thermal experience (sweat) test."
Triangulate your thoughts

Agnes Denes

Dialectic Triangulation: A Visual Philosophy 1970

Dialectic Triangulation is a simplification and systematic re-building of complexes of any subject or matter, through various methods, such as re-evaluation, re-grouping or division, at times starting with a single proposition, at others searching for the mean between two extremes. But each time it is the triangulation which institutes the interaction of a particular static state, being the activating force.

To use an example, if a person feels that within his knowledge he does not understand himself and his universe, and decides to attain greater knowledge, he has instituted a triangulation. His initiative, 'the desire to know more', being here the activating force between ignorance and wisdom.

Dialectic Triangulation is a building of progressive trichotomies, failing and succeeding in a dialectic method, each time arriving at a better thesis on a higher level—like changing scientific theories, which always advance and develop in complexity. By appraising the milestones in human knowledge and scientific achievement, we take inventory of it and of ourselves. A new curiosity and insight is born, a new awareness. And since this is an artistic probing, concrete facts are sometimes thrown into abstract corners, and abstract terms are concretized; each getting a sort of bath or soaking in the other's fluids. It is an explorative evolutionary process, the way of nature and man.

Types of triangulations:
inanimate tri-groups representing all of a genus, class or category
re-grouping or classification
accepted facts, perceptual or ideational errors re-evaluated, their importance re-established or denied—new ones created whenever possible
arriving at a conclusion derived from two propositions
arriving at a mean between two extremes
the building of one proposition through dimensional complication into trichotomies
the building of one proposition through divisional trisection into trichotomies
pure idea groups activated by controversy
interdependent or progressive ideas becoming effective through successive stages of advancement
threefold theories interchangeable—threefold theories not interchangeable, and those forming argumentative conclusions

Agnes Denes (right) programmed her computer display with the assistance of Theodor H. Nelson and The R.E.S.I.S.T.O.R.S. (from left) Peter Eichenberger, Lauren Sarno, John Levine (not present: Nat Kuhn).

Agnes Denes

Matrix of Knowledge & Trigonal Ballet 1970

(Work for computer display) with assistance from Members of The R.E.S.I.S.T.O.R.S., Pennington, N.J.: John Levine, Nat Kuhn, Peter Eichenberger and from Theodor H. Nelson

Restoration of the triangulation concepts on the screen can be at best only partial, mentally confronting the participant with the challenge of comparing ideas and the visual consequences of a new structuring. The artist's own structural conjectures are here shared with the viewer.

NOTE: Matrix of Knowledge schedules events in a triangular mesh. List structure is kept comparatively simple by rewriting the display file for each new incarnation of the picture. Trigonal Ballet animates through a succession of frames to obtain its "infinite effect."

The IDIOM, a dynamic display with its own built-in computer, is on loan from Information Displays, Inc. of Mount Kisco, New York.

Studies for thought-complication (completed 1970)
...GOES UP IN
John Baldessari
Cremation Piece, June 1969.

"One of several proposals to rid my life of accumulated pain. With this project I will have all of my accumulated pain cremated by a mortuary. The container of ashes will be interred inside a wall of the Jewish Museum. For the length of the show, there will be a commemorative plaque on the wall behind which the ashes are located. It is a reductive recycling piece. I consider all these paintings a body of work in the real sense of the word. Will I save my life by losing it? Will a Phoenix arise from the ashes? Will the paintings having become dust become art materials again? I don't know, but I feel better."
John Baldessari
Painting for Kubler, June 1969.
A lost painting: black on gray ground, oil on acrylic, 67½” x 56” from George Kubler's *Shape of Time; 1962*

“This painting owes its existence to prior paintings. By liking this solution, you should not be blocked in your continued acceptance of prior inventions. To attain this position, ideas of former paintings had to be rethought in order to transcend former work. To like this painting, you will have to understand prior work. Ultimately this work will amalgamate with the existing body of knowledge.”
A teletype terminal with a picture scope is connected with a digital computer on a time-sharing basis and serves both as input and output device.

Using the keyboard the visitors can answer questions which are posed to them on the scope. Due to branches in the polling program a number of these questions are personalized and vary from visitor to visitor.

Essentially the questions are of two types. One set asks the visitors for factual information about themselves, e.g., age, sex, educational background, income bracket, etc. The other set of questions inquires about their opinions on a variety of subjects.

The computer compiles the answers, compares them with information received from other visitors and correlates data relevant for a statistical breakdown.

A terminal prints out the processed information in the form of statistics giving percentages and cross-tabulation between answers, opinions and the visitors’ demographic background. The processing speed of the computer makes it possible that at any given time the statistical evaluations all answers is up to date and available. The constantly changing data is projected onto a large screen, so that it is accessible to a great number of people.

Based on their own information a statistical profile of the exhibition’s visitors emerges.

**Hans Haacke**

**Visitors’ Profile 1969**

with assistance from Scott Bradner (Art & Technology, Inc., Boston)

Digital Equipment Corporation (time share PDP-8 computer)

Local, national and international news is being received from U.S. as well as from foreign news services. It arrives in the exhibition via teletype print-out at the same time as it is being received by the other clients of the various news services. The print-out accumulates and piles up behind the teletype machines.
Douglas Huebler
Variable Piece No. 4
New York City, May 1969

Anyone who wishes to participate in the transposition of "information" from one location to another may do so by following the procedure described below. By doing so each participant will exchange an original secret normally located only within his, or her, head, for a photocopy of a secret submitted by another person at a prior time.

1. Write out, in simple language, an authentic secret never before revealed by you.
2. Slip this paper (unfolded) into the slot of the box provided for the receipt of "incoming" information. Your secret will be photocopied and, in turn, become the exchange information made available on a subsequent occasion.
3. The operator of the photocopy machine will acknowledge your submission by giving you the photocopy of another's secret. (If you choose, you may submit as many as five secrets and receive an equal number in return.)

Douglas Huebler
Variable Piece No. 5
Halifax, Nova Scotia, October 15, 1969

Ten students at the Nova Scotia College of Art and Design collaborated in the process that formed this piece. They did so by fabricating a myth and launching it into an original and true existence through ordinary information systems...word of mouth, publication, etc.

This process began in the Fall of 1969 and, although the myth possesses the capacity to expand to infinite points in time and space, for the purposes of this piece its destiny was set to be terminated on April 1, 1970 at which time all documents relating to its existence during the period described and this statement join altogether to constitute the form of the piece.

Douglas Huebler
Location Piece No. 13
Washington, D. C.; Haverhill, Massachusetts, November, 1969

On November 13, 1969, Joseph Moran, Managing Editor of the Haverhill Gazette agreed to have this artist serve as special correspondent and photographer for that newspaper and, in that capacity, to return a news story covering the experience of the so-called "Haverhill contingent" during the period of time that it travelled to and from Washington, D.C., and especially of its participation in the Peace March on November 15, 1969.

That report (as printed in the Gazette on November 17, 1969) joins with this statement, and three photographic contact sheets to constitute the final form of this piece.

Douglas Huebler
Variable Piece No. 15
Salem, New Hampshire, March, 1970

6 betting systems were devised and tested against the results of 82 nights of racing during the Spring, 1970 meeting at Rockingham Park, Salem, New Hampshire.

A description of each system and a chart recording its success (or lack thereof) join with 82 "Official Programs" and this statement to constitute the final form of this piece.

Reality does not lie beneath the surface of appearance; Everything looks like something; every thing is access the purposes of art. No thing possesses special status the world: nor does man.

I propose that the perceiver is the "subject" of art engaged in self producing activity through language, itself, replaced "appearance" and become the virtual of the work. Perception then, not being available through normal sensory experience shifts "empiricism" to "me empiricism": concepts and relations conceived beyond or material known through experience albeit related to such knowledge.
Ultrasonic waves (40KHz) reflected off interior surfaces, filling selected area.
with invisible, changing patterns and forms. (Space chosen at time of installation.)
Composer 1970

Composer is a study in the possibilities of humans interacting with machines for a creative purpose. It presents the opportunity to share and explore "ideas" with a music composition system, made up of an electronic music synthesizer, a digital computer, and other human beings (plus the equipment that interfaces these participants).

A music synthesizer is an electronic machine that produces all types of sounds by allowing its user to combine the essential elements of sound in unlimited variety. The basic building block is a sound called a sine wave, and any sound whatever may be put together by the proper combination of sine waves: a barking dog, an auto horn, a guitar—these are all comprised of numerous sine waves.

Our system uses the ARP Music Synthesizer built by the Tonus company, and the DEC PDP-8/I digital computer. The Composer program instructs the computer to produce sequences of numbers (digits) which are then translated by a digital-to-analog converter into sequences of electrical voltages. Since the ARP is a voltage-controlled instrument, the computer can thus control the Synthesizer.

Museum visitors may contribute their ideas to the composition by directly changing the computer program using electro-mechanical devices in front of four seats in gallery space. Visitors may also effect changes in the sound quality of the Synthesized music. Four people at a time may interact with the system so that the result is four-voice harmony in quadrophonic sound.

Our own software is what controls this composing system—the Composer computer program. The program aims at systematically controlling random events: Is it paradoxical that we can impose a system onto randomness? We set down some musical rules in the program (e.g., "Use a diatonic scale!"), and assign numbers to possible musical events (e.g., "a note will sound on the first beat of a measure—80% probability"); then the computer gives us a random list of numbers. When the appropriate number is hit upon as the computer passes out the random list, then the musical event happens in accordance with the program’s musical rules. The museum visitors are interacting by changing the skew of randomness of the sequence of numbers that come from the computer. By the way, this makes the Synthesizer very happy.
Ten solar battery and radio units will be installed on the roof of The Jewish Museum. The units will be individually connected to the ten panes of glass (including the two doors) at the front of the museum, by means of contact sound reproducers. Each glass surface then will give off sound with low volume information from the solar units above. The information will consist of the following:

1. **147-176 MHz VHF Police and public service radio band.** Audio monitor on state and local police, emergency services and civil defense.
2. **VHF/FM MHz—U.S. Weather Bureau broadcasting continuous weather bulletins for the immediate area.**
3. **C.B.S. Television Audio—Participants will listen to television, weather conditions permitting.**
4. **WINS 1010 AM constant international, national, and local news.**
5. **107-136 MHz VHF aircraft band—monitor of pilots, control towers and weather bulletins.**
6. **ABC Television Audio.**
7. **29-50 MHz VHF Police/Fire audio monitor of mobile phone and medical services, vehicular communications, fire and police emergency situations.**
8. **VHF/FM 162.55 MHz constant weather broadcasts.**
9. **N.B.C. Television Audio.**
10. **WCBS 880 AM constant news broadcasts.**

Participants will be expected to search out sounds along the front of the museum. The position of the sun along with weather conditions will determine which of the units will operate. Of course the piece will not function at night or during inclement weather. Consult your local newspaper as to the times the piece will be in operation (i.e., times of sunrise, sunset and weather forecasts).
One word leads to a story
Anyone entering the museum can enter the Conversation Room but they must enter it one at a time because it is a private though not necessarily intimate experience. Whoever chooses to enter the room will hear on entering a tape recorded message to the effect that, "If you wait a moment you'll hear a word, if you feel like it, listen to the word and then pick up the microphone and tell a story using the word. It would probably be more interesting if the story you tell is a true story, but that's up to you. Take as much time as you need to feel comfortable before beginning to speak. When you're through talking put down the mike and you'll be able to hear the work you've been part of." After he's finished talking the person will hear several other peoples' stories and finally his own, after which he leaves the room and someone else can come in. On some days whoever chooses to enter will hear two words or three words rather than one word. This will probably make it more difficult to tell a story, especially a true story, and will certainly take more time. Because of this the piece will use a voice-actuated microphone, so that very long hesitations will not be recorded. If anyone finds the task painful or too difficult, he has, of course, no obligation to play.

"Conversation is an improvisation on a limited number of words partly determined by the person you're talking to and partly by the weather." If somebody said that to me I'd have a strong tendency to answer with some of the same words, even if I intended to disagree or change the subject, e.g., "Yes, but I can ignore the weather," or "No, it's not the weather at all ..." and so on. What I want to do is take a list of words (about 10 of them) and present them 1 by 1 to somebody for a free improvisation, "a story", to make a poem, a stochastic poem consisting of a sequence of stories potentially 5 hours long on any given day, all of them built around the same word. It is something like crystal seeding. Take the word "born". It might yield a series of stories like:

"... She fought it out for three days and by the fourth day when she was ready she thought the hell with it and the baby was born with whatever anesthetics they wanted to use."

"I was born on D-Day."

"My mother said she was born on Christmas and my aunt said she was born on Easter. I thought everybody I knew was born on a holiday until somebody told me that in the old country they had so many children they never paid attention to real birthdays they just adjusted them to the nearest holiday."

...and so on
Order Idea is a systematic description of the universe, extending from the smallest known entities, the fundamental particles which comprise the atoms, through the hierarchy of organized matter, to the largest currently perceived entity, represented by the optical limit of the universe.

The hierarchy is divided into orders. An order, and the entities which comprise it, may be thought of as a level in a river-like cascade of "periodic tables" with each level comprised of smaller structures. Atoms are comprised of their fundamental particles, molecules are comprised of atoms, and so on, to increasingly larger structural orders. The sizes, shapes and durations of things are a result of the fundamental structure of the universe; the sizes, shapes and durations of entities within a particular order are imposed as a function of the entities' composition and the external, internal and stored energies acting upon it. The entities within orders have relatively long durations and may be compared with the horizontal levels in a cascading stream. The relatively rapid reorganizations of matter to form larger (lower order) or smaller (higher order) entities may be seen as the vertical falls of a cascading energy stream flowing from an unknown thermodynamic source to an unknown thermodynamic sink.

An example of solid matter "flowing" in a source—sink cascade on earth is: The 1st-Order stone shell of the Earth is heaved into 2nd-Order continental platforms and oceanic basins by the internal forces of the Earth. The continents are worn into 3rd-Order belts of plains, hills and mountains by rains driven by the Sun, even as the continents are lifted by forces within the Earth. Single 4th-Order mountains are broken into 5th-Order masses and boulders by frost, rains and impacts. These masses are broken into 6th-Order pebbles and 7th-Order silt which flows to the sea to be reconstituted again into the rocky rim of the mother continent.

Order Idea, and the visual, verbal and mathematical statements which comprise it, is a description, not an explanation, and represents a cross-section of a model of the universe intersecting perpendicular to its time-line and describing only selected events within one state of matter at the moment the events flow through this cross-sectional plane.
Tune in at 800 AM on your dial at The Jewish Museum or 610 AM on your dial at The Smithsonian Institution

We will broadcast continuously inside the museum the works of poets, which will be picked up by visitors on transistor radios with earplugs given out at the front desk. The programs will be 1½ hour tapes played on an automatic-reverse tape recorder. Each poet will be on for 15 minutes and there will be six different poets each day. The tapes will be changed daily.

Guerrilla Radio
Giorno Poetry Systems

Various transmitting equipment has been checked out, the most efficient assembled and operated at The Jewish Museum and The Smithsonian as a test guerrilla radio station. We processed out the problems and developed systems of programming, so that with simple instructions, anyone anywhere can set up a transmitter and start broadcasting.

Under FCC Low Power Transmission Regulations, it is legal to broadcast on the AM band without a license, if one transmits with 100 milliwatts or less power in a free space, not interfering with licensed stations, and have a 12 foot antenna or use carrier-current transmission. How to do it: buy the AM transmitter manufactured by Low Power Broadcast Co., 520 Lincoln Hwy., Frazer, Penna., 19355. Tel. no.: (215) Ni 4-4096. The guy to speak to is Dick Crompton. The transmitter costs $199 plus $30 for the capacitor, if you’re going to do carrier-current. Other equipment needed: a microphone and tape recorder (the better the quality, the better the broadcast quality), an AM radio, and depending on how much bread you have, one or two turntables, a mixer and more tape facilities.

Carrier-current transmission is being used in the Software Show. The transmitter with the capacitor plugs into a wall outlet, drawing its power from the line like any electrical appliance, and feeding its signal into the power line so that the signal can be heard on any AM radio (transistors, etc.) tuned into the operating frequency of the transmitter. The frequency is adjustable to a clear broadcast frequency in your area. The signal will travel on the electrical wiring until it hits a transformer, where it is wiped out. There are transformers every couple of blocks or in one large office or apartment building.

In using a 12 foot antenna, there is also the limited range of a few hundred feet or a couple of blocks. However, increasing the length of the antenna radically increases the range of reception. Penalties for knowing violation of FCC regulations are heavy. At St. Mark’s Church, we ran the antenna to the top of the bell tower and as we were testing it out, these two guys in blue business suits and grey crew-cuts, came in and said “We’re looking for John Giorno.” They flashed their badges and said, “We’re from the FCC.” They checked everything out and suggested the antenna be cut. One of them got up to me real close, looked in my eyes, smiled and said warmly “This is just a warning. If you violate it, it means a $10,000 fine and 10 years in prison.” So we cut the antenna and hooked up the transmitter to the organ pipes. You can also use the heating pipes in a building for transmission. They had apparently come because Howard Smith had written about Guerrilla Radio in The Village Voice that week. Since then we’ve heard that the FCC won’t hassle you, if you don’t advertise or become commercial and are not in competition with licensed stations. We hear kids in Connecticut have a hundred foot antenna and are broadcasting over a 30 mile area. Be sure they will hassle you if it’s a political trip.

Other ways of extending your range is to send your signal over the telephone lines to other transmitters which will broadcast it immediately. Perhaps in several areas in one city and from one city to another. There should be an exchange of tapes and information between guerrilla stations. Also it is possible to be mobile, broadcast from a truck and keep moving. The FCC has equipment that can pin-point the source of a signal in 15 minutes. Guerrilla Radio will be a web or grid of small radio stations linking everyone across the country and having no center.

The airways are free. The airwaves belong to the people.
Dear Susan:

As you see,
I am very lazy man......
    just Cafe revolutionary......

Village Voice reader///

I have waked up noon... on a beautiful
    Monday morning.

How much work I have DONE !!!

I picked up mail,
    sent 1 $37¢ to Reader’s Digest, because
    they scared me to send me law enforcement
    officials.
I had swallowed 99¢ lunch at DAVE’s corner
    made two phone calls and it is the third letter
    to write

......It is already 3 PM...
    time for nap...

maybe I read too much FEIFFER cartoon

If I were not lazy....

I would be teaching Gregorian Chant in the
    National University of Seoul
    in the Great Republic of KOREA,
    to underdevelop our developed cultural heritage....

flying Korean National Airlines
    (c-37 WW II—transport plane)

.............

John Cage said... Venice is the most advanced
town in the world, because it has abolished
    automobile...

According to this theory
    Korea is most advanced country, because it
    legalized POT.

our peasant is growing pot and selling openly to
    G.I.’s... since no Koreans know what it is
    how to enjoy... there is no law to prohibit...

and our country is the only producer of
    Ginseng... new darling of hippie

and my father was salesman of that Ginseng...

    it is, how I could get exit visa
    from my beloved country and
    skipped draft and glory of

   dying for the Freedom and democracy

   well, Have I read too much
   Jill Johnston????

I am so lazy that I postpone a letter, which could be
    just three lines, but end up writing 3 pages
    apology......
    it helps to exercise my English

.............

Enclosed are
1) CONFIDENTIAL PLAN OF STP COLOR TV synthesiser.
   two versions of essay, of which one chapter is dealt
   with Input-Out unit/
   there are some more hippier projects, which I
   will tell you in August... I think, I better
   visit you personally, in August, Because I move
   to Boston at the end of August...

Korean astrologer said that Lindsay will win with big margin,
    provided he drinks Ginseng tonic every morning...
    SWITCH TO EVO
Visual images make a real impression

*Linda Berris has a feeling for tactile-films.*
Smith-Kettlewell Institute of Visual Sciences
Vision Substitution System begun in 1959

This strange wheel chair with electronic components on its back and a television camera attached is the prototype of a Tactile Vision Substitution System being developed at the Smith-Kettlewell Institute of Visual Sciences, Pacific Medical Center, San Francisco, California. It is the work of a team of scientists including Paul Bach-Y-Rita, M.D., Carter C. Collins, Ph.D., and Benjamin W. White, Ph.D.

The System is designed to take an image picked up by the television camera and transforms it into a tactile image on the 400 vibrators mounted on the back of the wheel chair. A number of congenitally blind young people have been using the System, performing various experiments designed to see what the capabilities and limitations of such a device are. The hope is that such a machine may enable the blind to receive information by way of their skin which the sighted person would normally receive through his eyes. Thus far these blind subjects have been able to identify three dimensional objects and letters of the alphabet. Some are now able to discern the arrangement of several objects on a table top, correctly telling which one is in front and which in back. The limitations of the system encountered to date appear to be attributable to the crudeness of the device rather than to inherent limitations in the human skin as a channel for receiving visual information.

Linda Berris
Tactile Film

This is the first motion picture created to be felt as well as seen and heard. It is designed to be played back through the Vision Substitution System, which converts light images into tactile dotted images. Use of the System to transmit specially designed motion pictures is a new application for this System—one which is not part of the basic laboratory research. Work on the present film began over a year ago when Linda Berris conducted independent explorations to find out what kinds of images and movements could be most successfully conveyed through the System. The film reflects her findings in this personal project.

The film is both an explanation and a work of art. Poetic images are used to suggest scientific concepts related to touch and other senses and to demonstrate some of the possibilities of the System. The sense of touch is the primary consideration in the organization of the film and in the design of each image. Simple abstract forms—such as lines, circles, and squares—convey the meaning of the film in universal symbols. (To identify more complex shapes, participants would need hours of training with the System.)

William Vandouris
Light Pattern Box (Electrochrome)

The Electrochrome is a type of visual organ or piano. When the viewer presses one of the keys on the keyboard, a pattern of colored lights appears on the screen. He can play in any rhythm he likes, or he can set the machine to change patterns automatically. The Electrochrome, an independent project of William Vandouris, was designed for use by the sighted. The Electrochrome is not part of the basic laboratory research being conducted with the Vision Substitution System. However, combining the Electrochrome with the Vision Substitution System in this exhibit enables participants to choose patterns which they can feel on their backs as well as see.
The message behind the media
We are surrounded by a causal reality, bordered by our concepts of birth and death. Inside this reality we stabilize ourselves by making decisions. The Boolean Image is a matrix built upon this supposition. It is a womb containing decisional cues. These cues are neutral elements placed into specific relationships with each other. On these elements we hang decisions, labels which make them into anything we decide them to be. Since such decisional cues often occur in relational groupings or sets the matrix was named after George Boole, the originator of set theory.

The Boolean Image is the esthetic. It is the ground upon which we make the rules for the game. It is the message behind the media. The neutrality of its cues can easily be mistaken as being meaningless or trifling.

Computer realizations displayed on the scopes in this exhibition are based upon Boolean Images whose decisional cues are alphanumerical. The computer can most easily sense this type of cue and convert it into the decisions of the artist, programmer, audience-collective.

Boolean images may not be immediately perceivable. In the Conceptual Typewriter program the Boolean Image is fairly easy to recognize.

The Boolean Image can also be understood as a medium in its own right, as shown in the photographs. While software might be thought of as a psychic integration of our own biological DNA program, the Boolean Image might be thought of as sensing into the nature of this program, by dealing with the triggering devices of which it is composed.

Note: Conceptual Typewriter is effectively table-driven from a scheduler (a virtual time-table), but packed into a curious list structure as well, for the handling of interactions and animations. This computer display was done with the assistance of The R.E.S.I.S.T.O.R.S., Pennington, N.J.: John Levine, Nat Kuhn, Peter Eichenberger & Lauren Sarno.

The Conceptual Typewriter may be thought of as the instrument created when the "Conceptual Typewriter" program is loaded into the IDIOM. Ten illuminated buttons on the control button-box represent ten concepts suggested by the I Ching. The viewer may add concepts or replace them with the buttons, or alter them with the light-pen.

The IDIOM, a dynamic display with its own built-in computer, is on loan from Information Displays, Inc. of Mount Kisco, New York.
The films represent both the views of the participating artists on the nature of Software, accomplished through direct interviews and group discussions, plus on location filming of the artists in their working environments. Emphasized is the particular relationship of the artist to the computer and other less sophisticated machines as opposed to the utilitarian and commercial usage for which they were originally intended.

The films will make no direct statement. Their purpose lies in accumulating the data forwarded by the participants in the show and disseminating it continually to each entrant to the museum. There will be no beginning nor end. Each will be simultaneously projected on a continuous loop.

The techniques employed by the films are straightforward in the "cinéma verité" tradition; no tricks or gimmicks are used. Since we were shooting at a ratio of 10-1 it was possible to explore informally the views of the artists which should provide insights not normally achieved in more structured interviews. The informality should assist the viewer to grasp the nature of his technological environment by the exposure of various aspects of it being used in ways to which he is unaccustomed.

The shooting schedule was spread out over an extended period, so that the crew with the assistance of the exhibition coordinator could arrange the most interesting and relevant coverage of the process of the exhibition in addition to the interviews, discussions and location filming.

Work: A Happening
September, 1969

1. A basement hallway is painted, and repainted, by professional contractors every Tues., Thurs., and Sunday, for three continuous weeks. Sprayers, rollers or brushes may be used.

2. Color for successive coats of paint to be chosen on the spot by the sponsors, at completion of each stage. Discussions with painters.

3. Whole process recorded on color video (with cooperation of painters). Transmitted live on full-screen enlargement for one week each, as a “selected short subject”, at the following types of movie houses: a) art films, b) skin flicks, and c) regular run theaters.

4. A slide transparency, superposed on each day’s transmission, will read: “Painting a Hallway by (Name of painting contractor)” thus providing him with free advertising. Painters will be free to demonstrate their skills, dedication and honesty, as well as make commercial spels for their company.

5. Broadcast time each night is exactly one half hour, say 7:00-7:30 P.M. Painting time, including setup and cleanup, about one and a half hours, say from 6:30-8:00 P.M. Video technician’s time, about the same, assuming equipment is set up in place at beginning of each week.

6. Ads will be placed in advance in the classified columns of newspapers and upon the bulletin boards of schools and shopping centers saying: “Painting a Hallway—Underground Film, at 7:30 P.M. at the (name of theater), Tues., Thurs., Sun., (dates),” thus giving the theater its advertising. Other ads will state that “Jewish Museum sponsors avant-garde television. For information call RI 9-3770”. A pre-recorded answer will tell about the Happening and direct the caller to the theater of the week. Thus the Museum will be advertised. The name of the artist need not be mentioned in any of this. But in a different area of communication, namely that of the arts journalists, his name may be mentioned. Thus he will get his advertising, too.

Brief Observations about Work:
- A room is repainted over and over again when it doesn’t need it.
- A live TV activity, i.e. video-vérité, is received as a pre-shot movie (cinéma vérité).
- A roughly similar Happening program is presented in three different socio-cultural contexts: arty, pornographic, and middlebrow.
- Real time is introduced into fictional time of the movie audience for whom the convention is to suspend the real; while for the painters, fictional time is introduced into real time, since the ordinary job has been made for them pointless but perhaps flattering, in view of its new function as communication.
- Information is less a matter of direct conveyance than it is a reprocessing and alteration: a hallway is repainted any number of times. The paint job is recreated literally and in the minds of the painters and others who are informed: it, therefore, becomes recreational instead of laborious....
- A presumptive work of art becomes a business commercial. But the advertising engaged in is so minimal and so misapplied that it becomes an absurdity (like repainting a room continuously). Hence, recreation, again.
- A museum presentation is accessible only at other non-museum showcases. In either case the institutions are engaged in “abnormal” functions.
Phyllis Kind Gallery, Chicago. Most were randomly distributed on the floor and covered with jello; some were stuck to the wall with chewing gum; the rest were for sale.

"Software is the programming material which any system uses, i.e. in a computer it would be the flow charts or subroutines for the computer program. In effect software in 'real' terms is the mental intelligence required for any experience. It can also be described as the knowledge required for the performance of any task or transmission of
communication. They say, 'It's going to be raining tomorrow' is software. All activities which have no connection with object or material mass are the result of software. Images themselves are hardware. Information about these images is software. All software carries its own residuals.

The residual may take the form of news, paint, television tapes or other so-called 'media'. In many cases an object is of much less value than the software concerning the object. The object is the end of a system. The software is an open continuing system. The experience of seeing something first hand is no longer of value in a software controlled society, as anything seen through the media carries just as much energy as first hand experience. We do not question whether the things that happen on radio or television have actually occurred. The fact that we can confront them mentally through electronics is sufficient for us to know that they exist. . . . In the same way, most of the art that is produced today ends up as information about art.
Artist exposes himself electronically

Les Levine
A.I.R. 1968-70

A.I.R. basically consists of a group of television sets in a museum which displays activity taped in my studio, showing museum visitors the artist in his natural environment. The images change position from monitor to monitor on a random basis.

I believe this brings the art process directly to the public environment and thereby makes a closer connection between art and general culture.

*Note: Les Levine's original proposal consisted of constant direct coaxial transmission from his studio for the duration of the exhibition. This approach was abandoned when it was found that line-of-sight transmission was impossible.*
Les Levine
Wire Tap 1969-70

Wire Tap is a series of twelve speakers, each measuring 12" x 12", and containing a series of conversations between myself and anyone who telephones me during the day. People will hear these conversations as they pass by them.
New generation of whiz kids
The R.E.S.I.T.O.R.S.* are a group of students from the Princeton, N.J. area who are whizzes with computers. In their barn headquarters, they do highly technical work with five computers which they either own or use on loan. They have exhibited in the last three Spring Joint Computer Conferences. Their enterprising spirit was the highlight of one conference where, during a strike when no telephone equipment was available, they successfully managed to activate their display by hooking into a pay telephone.

At the 1970 Conference, they set a precedent by giving the first student technical talk, which drew the largest audience of the entire conference program. They will soon publish a primer on computer language (Trac).

Joseph Kosuth
The Seventh Investigation (Art as Idea as Idea)
Proposition One 1970

Form of presentation: One paragraph of text, ambiguous in meaning, will be placed in four contexts: billboard in Chinatown, New York City (in English and Chinese); advertisement in The Daily World; a banner in Turin (in Italian); temporarily in The Museum of Modern Art's Information Exhibition.

Museum presentation installation: One area will be filled in the following manner—On the walls will be photographic blow-ups of each section of the proposition's form of presentation, and on a table will be placed an assortment of information relevant to the work.

While certainly some of the elements I use in my investigations are of more importance than others, it is not possible to construct a mental image or 'icon' from the elements used—as you could in my work of a couple years ago. The elements I use in my propositions consist of information. The groups of information types exist often as 'sets' with these sets coupling out in such a manner that an iconic grasp is very difficult, if not impossible. Yet the structure of this set coupling is not the 'art'. The art consists of my action of placing this activity (investigation) in an art context (i.e. art as idea as idea).

The specific quality of the items used in a form of presentation and in a museum presentation installation are of a temporal nature directly related to taste. In other words it is necessary for me to choose a particular way at this time which is neither 'important' in its own right, nor deliberately 'unimportant' in an arty manner. This problem exists because of the still prevalent belief that there is a conceptual connection between art and esthetics—thus it becomes assumed that there is artistic relevance to my choices based on taste. Fifty years from now if my idea of art is extant it will be so only through the activities of living artists, and the taste I showed in my choices of the installation for this show will be dated and irrelevant.

Artists

Antin, David, Born 1932, New York. Lives in Solana Beach, Calif. Education: science and language studies; graduate work in linguistics. Occupation: poet, or artist working in language, art critic, Director of the Gallery for the University of California at San Diego, where he is a member of the Visual Arts Department. Currently working on a film exploring the relations between intermittently overlapping sound track and image sequences, a set of scenarios for dancers and actors, a volume of "poems" called Meditations (to be published by Black Sparrow Press in September 1970), and a book on Art and Technology for Viking Press.

Engmann, Robert Duncan, Born in Peking, China. Lives in Lexington, Mass. Education: Harvard University, B.A.; Royal University of Upsala, Sweden. Ph.D. Affiliated with Northeastern University, Boston, and Raytheon Corp.

Publisher of Culture Hero, monthly newspaper, N.Y.

Sheridan, Sonia, Born 1925, Newark, Ohio. Lives in Wilmette, Ill. Education: Hunter College, A.B.; the California College of Arts and Crafts, M.F.A.; Columbia University; the Taiwan She Da University. Associate professor at the School of the Art Institute of Chicago. Numerous museum group shows, last one man show at the Rosenblum Gallery in Chicago in 1967. Most recent work in electric graphics.
